(Germany)
Abstract

This document tries to use all elements that exist in GAPDoc. In addition, the final output not only contains the usual content, but also an appendix with the source text. There are also links from the usual content to the corresponding source text. This should enable new users to learn GAPDoc quickly.

Colophon

This is the Colophon page.
Text before chapter 1. (→ B.2)
Chapter 1

Sectioning Elements

Text before the section 1.1. (→ B.2)

1.1 Normal subsections

(→ B.3)

1.1.1 A subsection

This is text in the first subsection.

1.1.2 Another subsection

This is text in the second subsection. This subsection has a label, such that one can reference it.

1.2 ManSections

(→ B.4)

1.2.1 f

▷ f(x[, y])

Returns: an element in IsBlubb (1.2.8) or fail.

This function calculates something.

1.2.2 \~\{\} (for nothing)

▷ \~\{\} (c)

This method is for an operation with a tricky name.
1.2.3 MyOperation
▷ MyOperation(x) (operation)

The operation MyOperation operates on x.

1.2.4 MyOperation (First)
▷ MyOperation(x) (method)

This method calculates something by the generic method.

1.2.5 MyOperation (for bla)
▷ MyOperation(x[, good_hint]) (method)

This is the super-fast method for the operation MyOperation (1.2.3) if the argument x is in the representation IsBla (1.2.7). It will become even faster if the optional argument good_hint is given.

1.2.6 MyConstructor
▷ MyConstructor(filt, x) (constructor)

The constructor MyConstructor constructs from x an object in filt.

1.2.7 IsBla
▷ IsBla(obj) (representation)

For objects in this representation there is a super-fast method (see MyOperation (1.2.5)) for the operation MyOperation (1.2.3).

1.2.8 IsBlubb
▷ IsBlubb(obj) (property)

A property.

1.2.9 NumberBlobbs
▷ NumberBlobbs(obj) (attribute)

An attribute. Number of blobbs.

1.2.10 AllBlibbs
▷ AllBlibbs (global variable)

This global variable holds a list of all blibbs.
1.2.11 BlibbsFamily

- BlibbsFamily (family)

  Family of all blibbs.

1.2.12 InfoBlibbs

- InfoBlibbs (info class)

  This info class is used throughout the library of blibbs.
Chapter 2

Other Markup

2.1 Various types of text

[→ B.5] In this section we present examples for all the various types of text that are possible in GAPDoc:

• This is emphasized.

• Keywords are typeset like this and that.

• Arguments of functions have an element. They look like this: x and y.

• Code can be written with the Code element: if x = y then Print("Equal"); fi; or while true do Print("Hello"); od;.

• Filenames have their own element: /usr/local/ca/gap4r2 or pkg/xgap/doc.

• Buttons, menus, menu entries, and such things are also supported: OK or CANCEL.

• Packages are typeset like this: Small Groups Library

• Quoted text: “This is a text in quotes.”

Paragraphs are separated by the empty Par or P element.

Alternatives for different output formats: This is LATEX output.

There are also three elements to typeset “verbatim-like” text. (→ B.6)

The first is a Listing:

```
Sieve := function(n)
    # Returns the primes less than n
    local l,p,i;
    l := [1..n]; Unbind(l[1]);
    p := 2;
    while p^2 <= n do
        if IsBound(l[p]) then
            i := 2 * p;
            while i <= n do Unbind(l[i]); i := i + p; od;
            fi;
        p := p + 1;
    fi;
```

GAP code

8
od;
return Compacted(l);
end;

Here is a Log of a GAP session using this function:

gap> Sieve(100);
gap> Length(last);
25

Here is a GAP Example session that is automatically tested:

gap> s := Size(CharacterTable("M");
808017424794512875886459904961710757005754368000000000
gap> s < 10^53;
false
gap> s < 10^54;
true

2.2 Formulae

There are three types of formulae.

The first is the normal math mode of LATEX: \( b_i \cdot b_j = \sum_{k=1}^{d} h_{ijk} b_k. \) Then there are displayed formulae:

\[
\Rightarrow \left( \sum_{i=1}^{d} x_i b_i \right) \cdot \left( \sum_{j=1}^{d} y_j b_j \right) = \sum_{k=1}^{d} \left( \sum_{i,j} x_i y_j h_{ijk} \right) b_k
\]

If possible, use the Alt element to specify a better readable text version of such a formula as in the following example:

\[
\Rightarrow \left( \sum_{i=1}^{d} x_i b_i \right) \cdot \left( \sum_{j=1}^{d} y_j b_j \right) = \sum_{k=1}^{d} \left( \sum_{i,j} x_i y_j h_{ijk} \right) b_k
\]

For small formulae without “difficult” parts use the M element: \( b_i, x^2, x^2 + 2x + 1 = (x+1)^2. \) Note that here whitespace matters for text (or HTML) output.

Here are two formulae containing less than characters which are special characters for XML: \( a < b < c < d \) and \( e < f. \)

Using the Mode attribute of a Display element formulae like

\[
\Rightarrow a \rightarrow a \mod m
\]

can also be displayed nicely in text and HTML output.
2.3 Crossreferencing

[→ B.8]

In this section we demonstrate various references to parts of this document. Here is a reference to this section: 2.3. Here is a reference to chapter 1, to appendix A, and to subsection 1.1.1.

We distinguish among others references to functions (see \texttt{f (1.2.1)}), to methods with tricky name (see \texttt{\sim \{\} \{\}\sim \& (1.2.2)}), to operations (see \texttt{MyOperation (1.2.3)}), to methods (see \texttt{MyOperation (1.2.4)} or \texttt{MyOperation (1.2.5)}), to filters (see \texttt{IsBlub (1.2.7)}), to properties (see \texttt{IsBlubb (1.2.8)}), to attributes (see \texttt{NumberBlobbs (1.2.9)}), to variables (see \texttt{AllBlibbs (1.2.10)}), to families (see \texttt{BlibbsFamily (1.2.11)}), and to info classes (see \texttt{InfoBlibbs (1.2.12)}).

There are also references to labels: see 2.3, to other books: see (GAPDoc: What is a DTD?) or \texttt{IsSubgroup (Reference: IsSubgroup)} in the GAP reference manual.

References to sections come in two styles: \texttt{i} or \texttt{Sectioning Elements}'.

Another type of cross referencing is bibliography. Here is a citation: [CR81, (5.22)] is an interesting lemma.

There are also URLs:

\url{https://www.math.rwth-aachen.de/}

Email addresses have a special element: Frank.Luebeck@Math.RWTH-Aachen.De

and Homepages another one: \url{https://www.math.rwth-aachen.de/~Frank.Luebeck/}

And here is a link to the EDIM archives.

One can generate index entries as follows (look up the words “\texttt{T\TeX-UserGroup}”, “RWTH”, “Aachen, Hauptbahnhof”, and “GAPDoc, for GAP programmers”).

2.4 Lists and Tables

[→ B.9]

There are

• lists

• enumerations, and

• tables

or:

1. lists

2. enumerations, and

3. tables

or with marks:

lists: not numbered

enumerations: numbered

tables: two-dimensional
Lists can also be nested:

1. (a) first item of inner enumeration
   (b) second item of inner enumeration
2. • first item of inner list
   • second item of inner list

Here is a table:

<table>
<thead>
<tr>
<th>Object</th>
<th>Price</th>
<th>available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shoe</td>
<td>$1.00</td>
<td>there</td>
</tr>
<tr>
<td>Hat</td>
<td>$2.00</td>
<td>not there</td>
</tr>
</tbody>
</table>

Table: Prices

2.5 Entities and Special Characters

[→ B.10]

Here is a table of special characters, the first two are special for XML and must be typed in by entities in GAPDoc documents. The other characters are special for \LaTeX but in GAPDoc they can be typed directly.

| & | < | > | # | $ | % | ~ | \ | { | } | _ | ~ |

Table: Special characters in character data

And here are the predefined entities in GAPDoc:

| \&GAP; | GAP |
| \&GAPDoc; | GAPDoc |
| \&TeX; | \TeX |
| \&LaTeX; | \LaTeX |
| \&BibTeX; | \BibTeX |
| \&MeatAxe; | MeatAxe |
| \&XGAP; | XGAP |
| \&copyright; | © |

Table: Predefined Entities in the GAPDoc system

And some more for mathematical symbols: C, Z, N, P, Q, H, R.
Appendix A

An Appendix

</Description>
</ManSection>
B.5 Various Types of Text (Source)

In this section we present examples for all the various types of text that are possible in \GAPDoc;:

- **This** is **emphasized**.
Keywords are typeset like <Keyword>this</Keyword> and <K>that</K>.

Arguments of functions have an element. They look like this: <Arg>x</Arg> and <A>y</A>.

Code can be written with the Code element:
<Code>if x = y then Print("Equal"); fi;</Code> or
<C>while true do Print("Hello"); od;</C>.

Filenames have their own element:
<File>/usr/local/ca/gap4r2</File> or <F>pkg/xgap/doc</F>.

Buttons, menus, menu entries, and such things are also supported: <B>OK</B> or <Button>Cancel</Button>.

Packages are typeset like this:
<Package>Small Groups Library</Package>

Quoted text: <Q>This is a text in quotes.</Q>

Paragraphs are separated by the empty <C>Par</C> or <C>P</C> element.

Verbatim-like text (Source)

There are also three elements to typeset <Q>verbatim-like</Q> text.

The first is a <E>Listing</E>:

<Listing Type="GAP code">
<![CDATA[Sieve := function(n)
  # Returns the primes less than n
  local l,p,i;
  l := [1..n]; Unbind(l[1]);
  p := 2;
  while p^2 <= n do
    if IsBound(l[p]) then

</Listing>
i := 2 * p;
while i <= n do Unbind(l[i]); i := i + p; od;
fi;
p := p + 1;
return Compacted(l);
end;]

Here is a <E>Log</E> of a &GAP; session using this function:

<Log>
gap&gt; Sieve(100);
[ 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61,
  67, 71, 73, 79, 83, 89, 97 ]
gap&gt; Length(last);
25
</Log>

Here is a &GAP; <E>Example</E> session that is automatically tested:

<Example>
gap&gt; s := Size(CharacterTable("M"));
8080174247945128758886459904961710757005754368000000000
gap&gt; s &lt; 10^-53;
false
gap&gt; s &lt; 10^-54;
true
</Example>

B.7 Formulae (Source)

There are three types of formulae. <P/>
The first is the <E>normal math mode</E> of &LaTeX;:

<Math>b_i \cdot b_j = \sum_{k=1}^d h_{ijk} b_k</Math>.

Then there are <E>displayed formulae</E>:

<Display>
\Longrightarrow \quad \left(\sum_{i=1}^d x_i b_i \right) \cdot \left(\sum_{j=1}^d y_j b_j \right) = \\
\sum_{k=1}^d \left( \sum_{i,j} x_i y_j h_{ijk} \right) b_k
</Display>

If possible, use the <C>Alt</C> element to specify a better readable text
version of such a formula as in the following example:

\[ \Longrightarrow \quad \left( \sum_{i=1}^{d} x_i b_i \right) \cdot \left( \sum_{j=1}^{d} y_j b_j \right) = \sum_{k=1}^{d} \left( \sum_{i,j} x_i y_j h_{ijk} \right) b_k \]

For small formulae without difficult parts use the \texttt{M} element: \texttt{M}b_i\texttt{M}, \texttt{M}x^2\texttt{M}, \texttt{M}x^2 + 2x + 1 = (x + 1)^2\texttt{M}. Note that here whitespace matters for text (or HTML) output.

Here are two formulae containing less than characters which are special characters for XML:
\texttt{M}<![CDATA[a < b < c < d]]></texttt{M}> and \texttt{M}e &lt; f</texttt{M}>.

---

**B.8 Crossreferencing (Source)**

In this section we demonstrate various references to parts of this document. Here is a reference to this section: \texttt{Ref Sect=Cross/}.

Here is a reference to chapter \texttt{Ref Chap=First/}, to appendix \texttt{Ref Appendix=Appendix/}, and to subsection \texttt{Ref Subsect=Asub/}.

We distinguish among others references to functions (see \texttt{Ref Func=f/}), to methods with tricky name (see \texttt{Ref Meth=\texttt{\{\}\}\&lt;\&amp; Label=for nothing/}), to operations (see \texttt{Ref Oper=MyOperation/}), to methods (see \texttt{Ref Meth=MyOperation Label=First/} or \texttt{Ref Meth=MyOperation Label=for bla/}), to filters (see \texttt{Ref Filt=IsBla/}), to properties (see \texttt{Ref Prop=IsBlubb/}), to attributes (see \texttt{Ref Attr=NumberBlobbs/}),
to variables (<Ref Var="AllBlibbs"/>),
to families (see <Ref Fam="BlibbsFamily"/>),
and to info classes (see <Ref InfoClass="InfoBlibbs"/>).

There are also references to labels: see <Ref Text="here" Label="there"/>,
to other books: see <Ref Sect="syntaxXML" BookName="gapdoc"/> or
<Ref Oper="IsSubgroup" BookName="ref"/> in the &GAP; reference manual.

References to sections come in two styles:
<Ref Chap="First" Style="Number"/>
or <Ref Chap="First" Style="Text"/>.

Another type of cross referencing is bibliography. Here is a
citation: <Cite Key="CR1" Where="(5.22)"/> is an interesting lemma.

There are also URLs:

<URL>https://www.math.rwth-aachen.de/LDfM/</URL><P/>

Email addresses have a special element:
<Email>Frank.Luebeck@Math.RWTH-Aachen.De</Email>

and Homepages another one:
<Homepage>https://www.math.rwth-aachen.de/~Frank.Luebeck/</Homepage>

One can generate index entries as follows (look up the words
<Q>&TeX;-UserGroup</Q>, <Q>RWTH</Q>, and <Q>Aachen, Hauptbahnhof</Q>).
<Index Key="&TeX;-Usergroup">&TeX;-UserGroup</Index>
<Index Key="RWTH">RWTH</Index>
<Index Key="Aachen">Aachen</Index>
<Index Key="Hauptbahnhof">Hauptbahnhof</Index>
<Index Key="GAPDoc">GAPDoc</Index>
<Index Key="&GAP; programmers">&GAP; programmers</Index>
